

Agentpay [ABHISHEK · U · PAI]

Standard Workflow

Possible Cases

1) Beginner (user) with budget < min price

extract-Shopping-Intent()

↓
Build the primary recommendation

→ Calculate Budget Stretch

→ Select the best shoe (lowest price, highest Rating)

↓
User Approves product

↓
Build the complementary recommendation

→ prefer (Less expensive useful product)

Options

→ select All → adds everything + checkout

→ select Individual → adds selected + checkout

→ checkout without

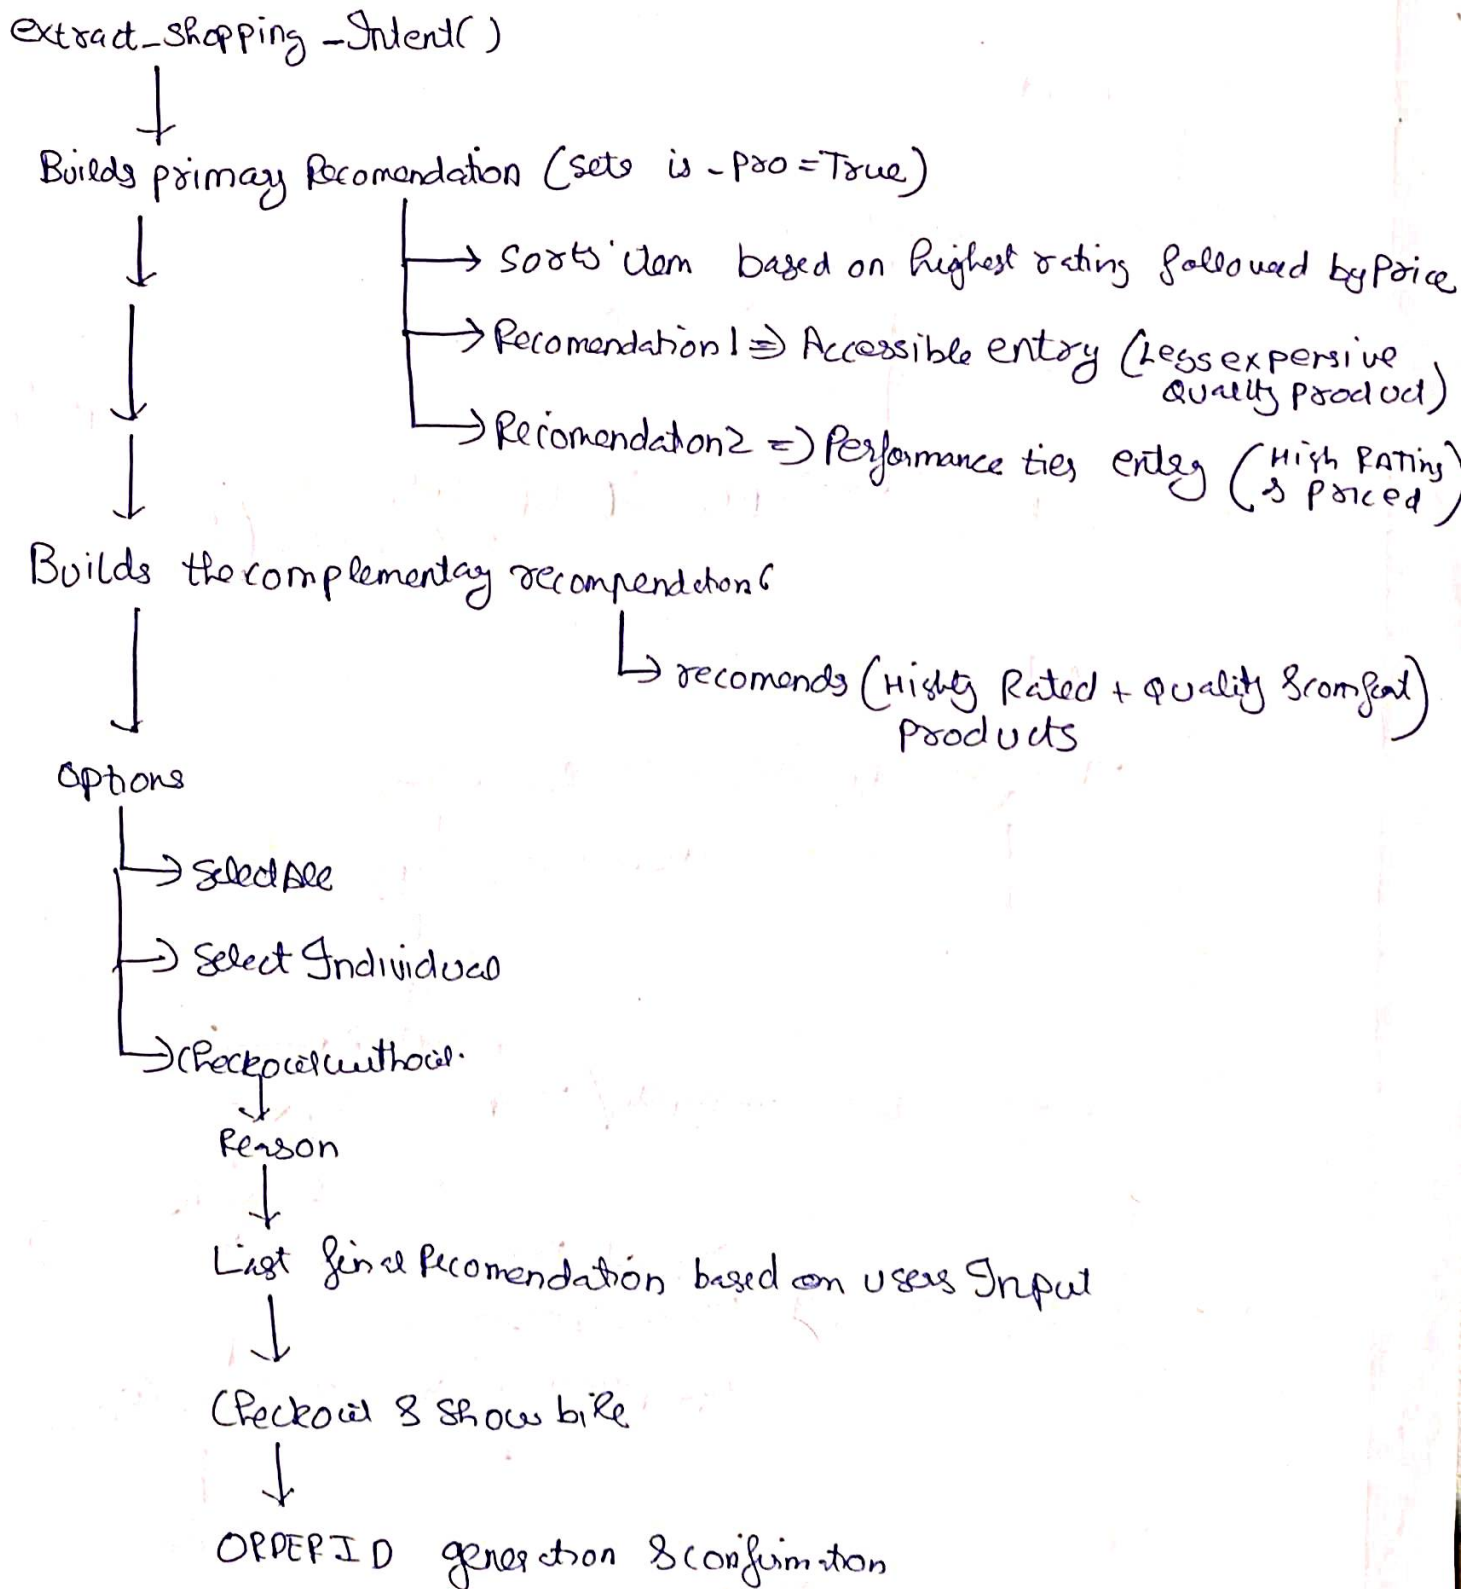

↓
Reason (too exp, not relevant, brand, no need of prod, other)

↓
Last final recommendation based on user input

↓
checkout & show bill

↓
ORDER ID generation & confirmation

2) Professional (user) with budget < min price

3) Any experience level with budget ($\text{min price} < \text{Budget} < \text{Avg Price}$)

extract - shopping - Intent()

↓
Build primary Recommendation

↳ if beginner / Intermediate / professional

↳ Shows Recommendation 1 as Highest quality & Highest Priced pdt within budget

↳ Shows Recommendation 2 as Highest priced and rating pdt within budget.

↓
Sub recommendation System

↳ Lists pdt and In such a way that Highest rating is preferred above price

↓
options

↳ select All

↳ select Individual

↳ checkout without

↓
Person

↓
Final Recommendation

↓
Checkout & show bill

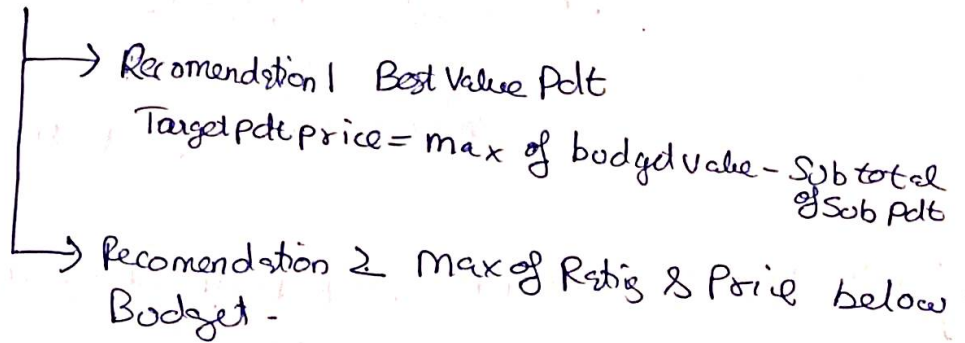

↓
ORDER ID generation & confirmation

4) Beginner / Intermediate (uses) with budget $\geq$ Avg Price

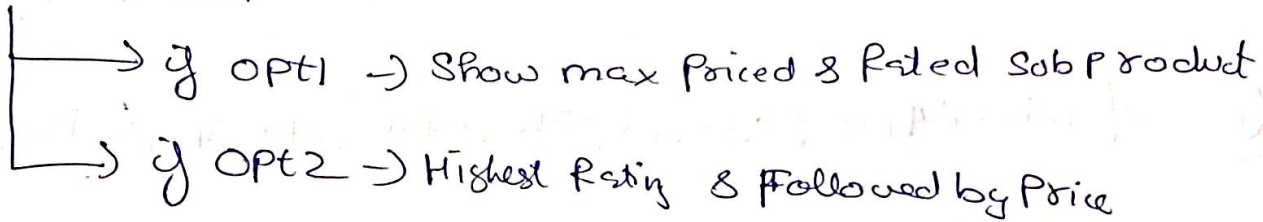

Extend Shopping Intent

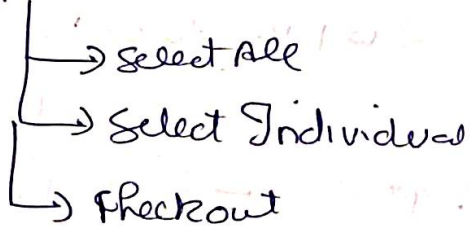

Build primary Recommendation

Sub recommendation

Options

Reason

final Recommendation based on users Input

ORDERED generation & bill confirmation

5) Professional & Budget > Avg price

Extract - Shopping Intent

Build Primary Recommendation

→ Recommendation (Highest Rated pdt within budget)

→ Recommendation 2 Highest Rated overall item in Category and asks for budget stretch

Options

Sub/Complementary Recommendation

↳ Sorts Items based on rating followed by price

Options

→ if selectable / Individual → checkout

→ checkout

↓
Person

final suggestion

Create bill & ORDER ID checkout.

CART System

User clicks select Recommendation in chat Interface

Backend Route calls POST api/buyer/select-recom

Select-Recommendⁿ Fcn) is called.

- append the Item to cart
- Recalculate the Remaining budget
- Log the event
- return cart state

Frontend updates [Pdt added to cart Right Side]

User Switches to Recommendation & Revenue page using toggle

Cart's length is detected

API call and extract data (Post/recovery/register-abandoned)

Backend executes the function (register-abandoned-cart()) and

appends info to audit-history

stores session

- Instantiates Abandoned Cart Session
- calls session.getTotal() to calculate potential Revenue and left behind sales
